

Connect battery (no rotary switch)

Written By: Tanya Taylor

INTRODUCTION

For technical notes on remote battery power and solar power, [click here](#).

Step 1 — Scenario

- If your monitor is fitted with a rotary switch, you can switch from mains power (AC) to battery power (12 VDC) without touching the wiring. You just need to [connect your battery](#) first.
- If your monitor **doesn't** come with the rotary switch, you can wire in a remote battery to power your monitor.

Step 2 — Insert battery cable

- Pass the regulated 12 VDC ground and power wires from your battery through one of the grey glands on the floor of the monitor.

⚠ Any remote battery power supply must be regulated 12 VDC.

Step 3 — Disconnect AC mains wires

- Find the 12 VDC mains cable enters the monitor through a gland in the floor.
- Disconnect the 12 VDC (red) wire from your mains power supply from the fuse input.
- Disconnect the ground (black) wire from the mains supply from the ground rail.
- Electrically isolate the ends of the wires with a terminal block or electrical tape. This ensures the monitor won't be damaged if someone else reconnects mains power.

Step 4 — Connect battery wires

- Connect the 12 VDC (red) wire from your battery to the input of the fuse.
- Connect the ground (black) wire from the battery to any of the ground terminals on the right of the power rail.
